                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Š
                         The invention provides mouse polypeptides for treatment of diseases due to abnormal proliferation of smooth muscle. The polypeptides can be produced by standard recombinant methodology. The polypeptides can be used according to their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating arteriosclerosis or renarrowing by vascular endothelial thickening after percutaneous transuluminal coronary angioplasty (PTCA), or myoma, hematopoietic cell-regulatory activity, cytokine activity, tissue generation/reparation activity, actin/inhibitin activity, taxis and chemotaxis activity, blood computation/thrombotic activity, receptor/ligand activity, cadohelin/ The present sequence represents the coding sequence of one protein of the continuous which can be used for modulating smooth muscle cell

The invention provides mouse polypeptides for treatment of diseases due to abnormal proliferation of smooth muscle. The polypeptides can be produced by standard recombinant methodology. The polypeptides can be used according to their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating arteriosclerosis or renarrowing by vascular endothelial thickening after percutaneous transuluminal coronary angioplasty (PMCA), or myoma, hematopoletic cell-regulatory activity, cytokine activity, issue generation/reparation activity, actin/inhibitin activity, taxis and chemotaxis activity, blood coagulation/thrombotic activity, receptor/ligand activity, cadohelin/ tumour metastasis inhibiting activity; tumor inhibition, and as nutrient. The present sequence represents the coding sequence of the invention which can be used for modulating smooth muscle cell proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cell proliferation; vascular; smooth muscle cell; arteriosclerosis; PTCA; endothelial thickening; percutaneous transuluminal coronary angioplasty; myoma; hematopoietic cell-regulation; cytokine; tissue generation; taxis; actin activity; chemotaxis; blood coagulation; thrombotic; tumor; mouse;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ş
                                                                 The invention provides mouse polypeptides for treatment of diseases due to abnormal proliferation of smooth muscle. The polypeptides can be produced by standard recombinant methodology. The polypeptides can be used according to their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating arteriosclerosis or retransuluminal coronary angioplasty (PTCA), or myoma, hematopoletic cell-regulatory activity, cytokine activity, tissue generation/reparation cagulation/thombotic activity, taxis and chemotaxis activity, blood tumour metastasis inhibiting activity, taxis and chemotaxis activity, candohelin/The present sequence of the invention which can be used for modulating smooth muscle

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                             polypeptides, and polynucleotides encoding them, can be used e.g. to induce DNA synthesis, to regulate vascular smooth muscle proliferation, to treat Marfan syndrome, to stimulate wound healing, to restore normal neurological function after trauma or AIDS dementia, to treat ocular disorders, to treat kidney and liver disorders, to promote hair follicular development, to stimulate growth and differentiation of epidermal and epithelial cells in vivo and in vitro, for the treatment of burns, ulcers and corneal
                                                                                                                                                                                        This claimed cDNA clone codes for a human polypeptide (see AAW31705) identified on the basis of homology as a putative extracellular protein-like/epidermal growth factor-like (EEGF) protein. It was isolated from a human foetal heart cDNA library, and can be amplified from ATCC 97285 and the product cloned into vectors for expression in bacterial, insect, mammalian or plant cells. EEGF
                                                                                                                                                                                                                                                                                                                    Nucleic acid encoding extracellular/epidermal growth factor-like protein - useful for treatment and diagnosis of e.g. wounds, neurological disease, neoplasia, psoriasis etc
                                       incisions, and to stimulate embryogenesis and angiogenesis. Nucleic acid fragments are also used as probes or primers, diagnosis and chromosome identification.
                                                                                                                                                                                                                                                                                           Claim 4; Fig 1A-D;
                                                                                                                                                                                                                                                                                                                                                                              WPI; 1997-512640/47.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequences AAS45925-AAS46231 represent DNA molecules encoding and PCR CC primers for PRO polypeptides of the invention. The sequences of the CC invention can be used to detect the presence of a tumour in a mammal by CC comparing the level of expression of a PRO polypeptide in a test sample CC of cells from the animal and a control sample of normal cells, whereby a CC chigher level of expression in the test sample indicates the presence of a CC tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be CC used to stimulate tumour necrosis factor (TNR) alpha release from human CC blood, when contacted with it. A specific polypeptide can be used to CC eximulate the proliferation or differentiation of chondrocyte cells. The CC PRO proteins can be used to determine the presence of tumours and also CC susceptibility to tumour development, particularly addrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian CC subjects. The oligonucleotide probes specific for the PRO nucleic acids on the used for general probes specific for the PRO nucleic acids.

New polynucleotide encoding extracellular matrix protein, Enuseful in the diagnosis, prevention and treatment of immune disorders and cancer
                                                                                                                  1999-095674/08
DB; AAW94281.
                                                   ECMP-1
```

This DNA encodes a human extracellular matrix protein (ECMP)-1. He cells containing a vector comprising the ECMP-1 nucleic acid are for the recombinant production of the protein. ECMP-1 and its (ant)agonists, are useful in the diagnosis, prevention, and treat of cancer and immune disorders. 79pp; English.

polynucleotide sequence was obtained from a human secreted protein AK647 polynucleotide sequence was obtained from a human foetal kidney cDN library. AK647 homologues in chicks and rodents are involved in acr tissue development. The spatial and temporal distribution of AK647 indicated that it acts as an a modulator of smooth muscle cells in vasculogenesis during embryonic development. The primary structure AK647 consists of multiple EGF domains. The AK647 protein can be us

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ω
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC The protein may also be used in the treatment of immune deficiencies and cother viral, bacterial and fungal infections. Regulation of immune certain including severe combined immunodeficiency (SCID), HIV and cother viral, bacterial and fungal infections. Regulation of immune certain include a role in the regulation of haematopotesis and in the cartilage, tendon, ligament and nerve tissue regrowth are also possible, cartilage, tendon, ligament and nerve tissue regrowth are also possible, cas well as for wound healing and in the treatment of ulcers and burns. CC antilage, smooth muscle cell growth, vasculogenesis, restenosis, catherosclerosis, blood vessel remodelling and degeneration. The proteins may also have activin/inhibin, chemotactic/chemokinetic, haemostatic and thrombolytic, receptor/ligand, anti-inflammatory, cadherin/tumour convasion suppressor, and tumour inhibition activity. Ak647 specific cantibodies can be used for promoting smooth muscle cell growth or can be used for proteins and polynucleotides can also be used for convasion, diagnosis and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                Query Match
                                                                              The sequence is that encoding a secreted protein from a human fetal kidney clone AK647. Such a sequence is predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, activity, activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, and tumour invasion suppressor activity, and tumour inhibition activity. It is also stated to be useful for gene

                                                                                                                                               This sequence encodes the human A55 protein of the invention. The protein can be used for the treatment of diseases due to abnormal proliferation of smooth muscle. The polypeptides can be used according their inhibition of the proliferation of vascular smooth muscle cells, particularly in treating arteriosclerosis or re-narrowing by vascular endothelial thickening after percutaneous transluminal coronary angioplasty (PPCA), or myoma, haematopoletic cell-regulatory activity, cytokine activity, tissue generation/reparation activity, actin/inhibin activity, taxis and chemotaxis activity, blood coagulation/thrombotic activity, receptor/ligand activity, blood coagulation/thrombotic activity, tumour inhibition, and as a nutrient.

Note: The open reading frame of this sequence, as well as the mature protein coding sequence are specifically claimed in claim 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A55 protein; human; smooth muscle proliferation; tissue generation; vascular smooth muscle cell; arteriosclerosis; tissue reparation; myoma; vascular endothelial thickening; haematopoietic cell-regulator; cytokine; percutaneous transluminal coronary angioplasty; blood coagulation; PTCA; actin; inhibin; chemotaxis; thrombosis; cadherin; therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                õ
                                                                                          isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel polynucleotide which is at cleast 95% identical with a sequence (AFCC 97285) encoding mature human extracellular protein-like/epidermal growth factor (EGF)-like protein, EEGF. Also included are the EEGF EGF domains, a vector containing the polynucleotide, a host cell containing the vector, anti-EEGF antibodies and antagonists of EEGF. The polynucleotide is used for creombinant production of EEGF, in gene therapy, as hybridisation probes, as antisense antagonists and for chromosome identification. The protein is used to treat patients who require EEGF, to identify specific antagonists, used to treat conditions that require inhibition of EEGF (e.g. vascular smooth muscle cell proliferation, Marfan syndrome, wound healing, neurological trauma, acquired immunodeficiency syndrome (AIDS)-related dementia, ocular disorders, birns, ulcers, corneal incisions, corneal inflammation, neoplasms and psoriasis), to raise specific antibodies and to characterise receptors. The present

The protein can also be used to treat senile dementia, ocular disorders such as corneal inflammation, CCC for targeting tumour cells, for treating kidney disorders, for liver CC regeneration or treating liver dysinction, for treating wounds including CC all cutaneous wounds, corneal wounds, and injuries to the CC all cutaneous wounds, corneal wounds, and injuries to the cepithelial-lined hollow organs of the body or resulting from trauma such as burns, abrasions and cuts as well as from surgical procedures such as corneal inclisions and skin grafting. The polypeptides can also be used CC surgical incisions and skin grafting. The polypeptides can also be used CC promote hair follicular development, to stimulate growth and CC differentiation of various epidermal and epithelial cells in vivo and in CC utroa and to stimulate embryogenesis. Antagonists to EEGF can be used to treat neoplasia such as cancers or tumours, skin disorders such as CC psondasia such as cancers or tumours, skin disorders such as cancers or tumours,
